SKILLS

Java

Spring Boot

Microservices

Event-driven architecture (SQS, SNS)

AWS (ECS, Lambda, S3, CloudWatch)

MySQL

REST APIs

Git

AI-assisted development (Claude)

LANGUAGES

Montenegrin – Native

English – C1

Profile

Java backend engineer with nearly 4 years building production services for a multi-tenant restaurant back-office platform processing ~900,000 checks a day across 4,000+ POS sites. Specialized in POS and financial integrations: built and owned the CBS NorthStar integration end to end and worked across 15 more, including Toast and Qu. Experienced in event-driven AWS workflows (SQS/SNS) and in decomposing the monolith, including a POS-processing extraction that cut processing time by 20%. Uses AI tools daily across investigation, design and testing, with output verified through tests and review.

EXPERIENCE

Software Engineer, SynergySuite, Podgorica, Montenegro

JAN 2023 — SEP 2026

- Built and maintained Java/Spring Boot services on AWS for a multi-tenant restaurant back-office platform serving 4,000+ active POS sites and ~900,000 checks a day.
- Built and owned the CBS NorthStar POS integration end to end: menu and inventory sync from the POS, employee sync back to it, and sales ingestion (POS reads, checks, sales lines and payments).
- Delivered it in ~2 months using Claude to analyze NorthStar’s API and documentation, map their DTOs to our domain model, plan the fetch-and-mapping flow, and draft unit and integration tests that confirmed the mapping, while owning the final design and code.
- Worked across 15 further POS integrations, including Toast and Qu, against vendor APIs that differ in auth, data model and delivery method.
- Moved POS processing out of the monolith into a standalone microservice, cutting processing time by 20%, and contributed to further extractions as the platform decomposed.
- Designed event-driven workflows on SQS and SNS to decouple integration processing from the core platform.
- Shipped features and fixes in financial reporting: the POS sales and payments that feed every outlet’s daily summary, and cashsheet generation for ~1,000 locations.
- Investigated and fixed production defects across the integration pipelines, from vendor-side failures to data landing incorrectly in the platform, using CloudWatch logs and metrics and MySQL analysis of high-volume sales and payment tables.

EDUCATION

M.Sc. studies, Computer Software Engineering, University of Montenegro

2021 — 2023

Coursework completed, thesis in progress

B.Sc., Computer Software Engineering, University of Montenegro

2018 — 2021
